Table 3. Experimental checks, assurance coverage and remaining questions.

Check	Question it answers	In the experiment	In the documents
Rerun unchanged	Same setup, same answers?	Tested: 2.78% of labels change	UK268 explicitly recommends identical-prompt repetition and UK071 similar-prompt consistency checks. AI Act Arts 9(6) and 15(1) impose broader consistency duties without naming a repeated-run agreement statistic in those provisions.
Compare setups	Do reasonable setups agree?	Tested: the seven retained GPT-4o alternatives differ from the anchor on 5.00%–11.58% of paired labels. Across 1,199 complete cases, 291 have varying labels and 215 agree with CAP under some configurations only. The comparison with later repeats is descriptive.	UK268, AI Insights and EDPS guidance address model comparison and evaluation. General comparisons differ from reporting which matched items change across plausible configurations and whether those changes matter.
Confidence and correctness	Does high confidence mean correct, and what share goes to review?	Tested: review share from under 1% to 41.0% at the same threshold	UK071 warns against confidence alone and AI Insights discusses uncertainty routing. EDPS risk guidance lists calibration among benchmark properties. These references differ from specifying validation of the final-label score and routing rule used in a particular task.
Agreement filtering	Does dropping disputed items inflate accuracy?	Tested: 835/1,199 (69.64%) to 717/908 (78.96%) for the anchor, using the eight retained configurations and matched complete cases.	Dataset-quality and representativeness expectations are relevant. The reviewed passages do not specifically address the accuracy increase from excluding configuration-disputed items; this does not establish that broader assessment duties are irrelevant.
Effect on the evidence	Do the conclusions drawn from the labels change?	Tested: the order and size of the largest topics	Risk, impact and intended-purpose assessment are relevant. These expectations do not by themselves specify the matched-classification analysis of topic membership, shares and rankings used here.
Local testing	Does the tool work on this body's own cases, not the provider's test set?	Not tested	UK guidance includes context-specific testing and illustrative metrics. EU duties include context-relevant datasets (Art. 10), deployer input-data and monitoring duties (Art. 26), and provider lifetime monitoring (Art. 72); these do not require every deployer to repeat every provider test.
Review effectiveness	Do reviewers catch errors, or defer to the tool?	Not tested	UK071 explicitly recommends testing users’ recognition of hallucinations, bias and off-topic outputs, as well as handover and override. ATRS asks how review is assessed/assured; Art. 14 addresses effective oversight and automation bias. These are expectations and guidance, not evidence of effectiveness in practice.
Drift after updates	Does the same setup give the same answers after the provider updates the model?	Not tested: provider aliases were used, not dated model versions	UK071 recommends fixed benchmark tests across versions, re-testing and monitoring with illustrative drift metrics. These are methods and examples, rather than one prescribed agreement statistic. Any template omission must be read within its scope.
Independent verification	Does anyone outside the provider check its claims?	Not tested	Before use, independent authorisation applies to specified police biometric uses, and third-party conformity assessment applies to specified systems. UK guidance mentions possible external audits for high-risk AI. The applicable route depends on the system and use. After the event, EU market surveillance authorities can re-evaluate a system and order corrective action, withdrawal or recall.
Ongoing monitoring	Are outputs logged and compared over time?	Not tested	AI Act Arts 26 and 72 address deployer and provider monitoring; UK071 provides re-testing, drift and baseline-comparison guidance. Support is described, while actual access and capacity are not measured.
